

## Flywheel Adapters

Flywheel adapter plate kits are ground for flatness, then machined to mate with the hub. Other industry suppliers require the customer to do the final machining of the outside diameter and drilling of the attaching holes to fit the clutch cover bolt holes in the flywheel but we can supply the adapters to you **complete**\*. All you do is bolt on and start testing. However, if you would like to do your own final machining because of budget concerns or you have in-house machining capability, the kits are available in a "rough-cut" diameter from 12" to 30".

\* Customer must ship us all components necessary (flywheel, clutch cover, etc) for proper and accurate final machining by Phoenix Dynamometer. Any components shipped to Phoenix Dynamometer for accurate final machining of adapter plates will be returned to the customer with the final order.
